Medicom

SafeTouch®

Gloves

I feel good...
and safe!

Made in Europe!

As a subsidiary of Medicom, ManiKHeir combines European manufacturing strength with the globally proven expertise of a leading provider in the field of infection control.
ManiKHeir is committed to a clear goal: to ensure that dentists have a reliable, consistently available supply of high-quality nitrile gloves – regardless of global supply chains.

Bessé-sur-Braye (Sarthe) ManiKHeir

For dental use, this means:

- Maximum delivery reliability – even in challenging times
- Consistent product quality across all batches, supported by standardized manufacturing processes
- Predictable availability, so you can focus entirely on your patients

Our modern European production facilities not only ensure short delivery times but also the highest standards of quality and control.

Latex Gloves vs. Latex-free Gloves

Latex gloves are often preferred by dental professionals since they provide the highest level of elasticity, comfort and fit. Surgeons often prefer latex gloves because they offer greater precision with high tactile sensitivity.

Despite latex's advantages, latex allergies have become more common, so many healthcare providers are opting for latex-free glove options such as vinyl or nitrile.

Made of synthetic latex, nitrile is considered an excellent alternative for people allergic to natural latex, since these gloves best resemble the stretchy feel of latex gloves and are also highly durable and puncture resistant. Nitrile gloves provide superior protection against contamination and infections.

Another difference to consider when deciding between latex and latex-free gloves is the protection offered by each type of material. In general, latex gloves offer the best protection against bacteria and viruses, while synthetic gloves provide better chemical protection. Of the different types of latex-free gloves, nitrile gloves offer a higher degree of protection against viruses as well as protection against chemicals.

Size table according to EN 420:

Size		Hand circumference	Hand length	Minimum glove length
6	XS	152 mm	160 mm	220 mm
7	S	178 mm	171 mm	230 mm
8	M	203 mm	182 mm	240 mm
9	L	229 mm	192 mm	250 mm
10	XL	254 mm	204 mm	260 mm
11	XXL	279 mm	215 mm	270 mm

Powder-free Nitrile Gloves

Nitrile gloves provide a second skin feel due to their soft texture. The improved polymer technology offers a comfortable fit to provide optimal dexterity in wet and dry conditions. Textured fingertips ensure better grip control. Nitrile gloves provide high puncture resistance three times better than latex and abrasion resistance.

Powder-free Latex Gloves

Latex gloves are very flexible and elastic. They provide outstanding fit, comfort and dexterity and have an extreme sensitivity for good grip control. Latex offers an excellent mechanical resistance to tearing and folding and an effective barrier against biological contaminating agents. Please note: Latex bears a possible risk of allergies in case of prolonged and direct skin contact.

Did you know?

Non-powdered gloves do not include cornstarch. This makes them more skin-friendly, stronger and more versatile. Powder-free gloves can be more expensive due to the process required to remove the powder coating from the glove. However, powder-free gloves cause fewer allergic reactions because they have a lower protein and chemical content. Powder-free gloves are also cleaner to use because they do not leave residue on clothing or surfaces.
